The first step is a dehydratio of threonine, followed by rehydration and liberation of ammonia. CATALYTIC ACTIVITY: L-threonine + H(2)0 = 2-oxobutanoate + NH(3)

FUNCTION: RECEPTOR ADENOSINE. THE ACTIVITY OF THIS RECEPTOR IS MEDIATED BY G PROTEINS WHICH ACTIVATE ADENYLYL CYCLASE.

-!- SUBCELLULAR LOCATION: Integral membrane protein.

-!- SIMILARITY: BELONGS TO FAMILY 1 OF G-PROTEIN COUPLED RECEPTORS.
                                                                                   STRAIN=BALB/C; TISSUE-Bone marrow;

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Score
